

Forklift Fork Positioner

Forklift Fork Positioner - The fork positioner is actually a hydraulic device that can allow the individual driving to be able to operate the forklift without leaving the seat. They are constructed out of high quality materials and are meant to be able to endure the most demanding operations and work surroundings. Side shifting units have the added ability to be able to laterally position the arms or the entire load in order to facilitate much more precise lifting and position in a faster and much more effective method.

The unique blade pocket design enables the one operating it to be able to safely sway the unit's blades without any fear of destroying the positioning cylinders. This allows the operator the option to either perform independent or simultaneous blade movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into fork positioners on existing units.
